# WIA- Presentation Assignment

The research for this assignment was very interesting. I had the chance to get to learn some animation tricks from my chosen plugin and others. My choice of plugin was aniJS. This jQuery plugin is a simple but powerful plugin. I chose this particular plugin because of its ease of use to create animations. It also reminded me of some of the animations that I see daily when using Google Search. I enjoyed learning about this plugin as well as others. AniJS is basically added and nested next to the element that you wish to animate. Like all, you must first make sure you have the script tag and the aniJS library linked to your page. Nested next to your desired element, you will then use the date-anijs tag with your if /and statement to create the animation. This simply animates with ease and shows a great presentation. You can combine styles to get different effects. This is a small package with a large presentation. Try aniJS for your next project!
